                Naming Conventions: EST name is generated by the concatenation of the dGI Clone Id and the direction of sequencing. The suffix '.rev' indicates a reverse sequencing read of the insert. It does not necessarily reflect the orientation of the insert.

Poly-A: Based upon the presence of a run of 14 or more T residues
                                                                                                                                                                                                                 Email: cdna@jgi.psf.org

```
Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Search time 43.8947 Seconds (without alignments) 6357.883 Million cell updates/sec

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Title: Perfect Result No. OM nucleic -Sequence: Run on: Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries Searched: Scoring table: Minimum DB seq length: 0 Maximum DB seq length: 200000000 Total number of hits satisfying chosen parameters: Database 0000 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. score: Score 19.6 19.6 19.6 nucleic search, using sw model 30 March 5, 2006, 17:08:23; Search time 19:9642 Seconds (without alignments) 10014:946 Million cell updates/sec US-10-713-381-2_COPY_1179_1208 Query Match IDENTITY_NUC Gapop 10.0 , Gapext 1.0 4996997 seqs, 3332346308 residues 100.0 100.0 100.0 100.0 100.0 100.0 100.0 80.7 73.3 66.7 66.7 66.7 66.3 65.3 65.3 5: 6: 7: 8: 9: 110: 113: N_Geneseq_21:* 1: geneseqn198 catgcttgttcaaccgttcgtcttgttcca 30 Copyright geneseqn2003bs:* geneseqn2003cs:* geneseqn2003ds:* geneseqn2003as:* geneseqn2002bs:* geneseqn2002as:* geneseqn2001bs:* geneseqn2001as:* geneseqn1990s:* geneseqn1980s:* geneseqn2004as:* geneseqn2004bs:* geneseqn2005s:* Length GenCore version 5.1.7 (c) 1993 - 2006 Biocceleration Ltd. Claim 5; Page 47; 50pp; English.

The invention provides a male tissue-preferred regulatory region (1) comprising nucleotide sequences essential for initiating transcription of the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (1) into a plant where the exogenous gene impacts male fertility of the plant and (1) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The

œ,

A male tissue-preferred regulatory region comprising nucleotide sequences essential for initiating transcription of the MS45 gene useful for mediating fertility in a male plant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                producing exogenous genes in a male tissue- preferred manner, which is useful in restoring or conferring fertility, such as in hybrid seed production. In conferring fertility, a monocot/dicot plant is transformed with the exogenous nucleotide sequence (a male sterility gene, preferably M945), which encodes a product selected from auxins, rolB and diptheria toxin. Hybrid seeds are produced by cross-pollinating maize male fertile and infertile plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is that encoding an Ms45 male tissue-preferred regulatory region. It may be used in the construction of a vector for a method of producing exogenous genes in a male tissue-preferred manner, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             M845; male; tissue-preferred; plant tissue; differentiated;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               08-JUN-1999

The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription of the M845 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a
                                                                                                A male tissue-preferred regulatory region essential for initiating transcription of mediating fertility in a male plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequence is that encoding an Ms45 male tissue-preferred regulatory region. It may be used in the construction of a vector for a method of producing exogenous genes in a male tissue- preferred manner, which is useful in restoring or conferring fertility, such as in hybrid seed production. In conferring fertility, a monocot/dicot plant is transformed with the exogenous nucleotide sequence (a male sterility gene, preferably Ms45), which encodes a product selected from auxins, rolB and diptheria toxin. Hybrid seeds are produced by cross-pollinating maize male fertile and infertile plants

                                                                                                              The invention provides a male tissue-preferred regulatory region (I) comprising nucleotide sequences essential for initiating transcription of the MS45 gene. A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a nucleic acid sequence encoding an Ms45 male tissue preferred regulatory region from Z. mays
                                                                                                                                                                                                                                                                                                    A male tissue-preferred regulatory region comprising nucleotide sequences essential for initiating transcription of the MS45 gene useful for mediating fertility in a male plant.

A method of mediating male fertility in a plant is provided that involves introducing an expression vector comprising a promoter operably linked to (I) into a plant where the exogenous gene impacts male fertility of the plant and (I) controls expression of the exogenous gene. A method of producing hybrid seeds is also provided. The present sequence represents a DNA fragment -38 to -195 bases upstream of the TATA box of a Z. mays M845 male-tissue preferred regulatory region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A male tissue-preferred regulatory region essential for initiating transcription of mediating fertility in a male plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAH76334;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an isolated lung specific nucleic acid (LSNA) comprising a sequence that: (a) encodes any of the 93 amino acid comprises comprising 17 - 733 amino acids, given in ABP528673 to ABP52965; (C) (b) comprises any of 115 sequences comprising 148 - 3193 base pairs (bp), (C) given in ABQ75262 to ABQ75376; (c) selectively hybridises to (a) or (b); (C) or (d) has 60 % sequences dentity to (a) or (b). LSNA and lung specific correction (LSP) sequences have cytostatic activity and can be used in gene (c) therapy and vaccines. LSNAs and LSPs are useful for diagnosing and (c) monitoring the presence and metastases of lung cancer in a patient. An (c) continues that specifically binds to an LSP can be used for determining (c) the presence of an LSP in a sample, as well as for treating a patient the (c) lung cancer, particularly by inducing an immune response against the (c) lung cancer cell expressing the LSNAs or LSPs. In particular, these LSNAs (c) imaging and treating lung cancer (e.g. squamous cell carcinoma) and non-cyc cancerous disease states in lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ACA44013 standard; DNA; 2397
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cell has been exposed, comprising: (a) contacting nucleic acid representative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress regionse. The method is useful in the production of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that in methods of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

The invention relates to an isolated nucleic acid comprising any one of CC the 6213 antisense sequences given in the specification where expression CC of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid CC encoding a polypeptide whose expression is inhibited by the antisense cCC nucleic acid; (2) a host cell containing the vector; (3) an isolated CC encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding CC polypeptide (3) producing the polypeptide; (6) inhibiting cellular cC proliferation, (7) identifying a compound that influences the activity of agene in an operon required for proliferation, (7) identifying a compound that influences the activity of containing the vector of the product or that has an activity against a biological pathway confidentifying a gene required for cellular proliferation or the biological pathway in which a proliferation, or that inhibits cellular proliferation of a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiocit; (10) profiling a compound that inhibits of the gene product is overexpressed or underexpressed; (12) determining the extent compound to a compound that inhibits of the gene product is overexpressed or underexpressed; (12) determining the extent contains; or (13) identifying the target of a compound that inhibits the contains; or (13) identifying the target of a compound that inhibits the containing or an organism. The antisense nucleic acids are useful for contentifying proteins or screening for homologous nucleic acids required condentifying proteins or for screening homologous nucleic acids required condentify and discovery programs. Or for screening homologous nucleic acids are useful condentify the condents or for a condentify the condent or homologous nucleic acids.

Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the stress, osmotic stress or any of their combinations. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New stress-responsive nucleic acid, useful responsiveness of a plant, e.g. cereal, to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, salt stress, osmotic stress or any of their combinations. The present sequence is the second of the present sequence is the second of the present sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Plant; gene; ss; transcription; plant genome augmentation; cereal; soybean; alfalfa; sunflower; canola; cotton; peanut; tobacco; sugar beet maize; barley; sorghum; rice; wheat; crop plant; insecticide resistance; stress tolerance; salt tolerance; cold tolerance; drought tolerance; plant; nutrition; apical dominance; dwarfism; early flowering; antiviral;

CC leaf- and/or stem-, panicle-, root- or pollen-specific or -preferential

CC or constitutive transcription of an operatively linked nucleic acid

CC segment. The invention also relates to a method for augmenting a plant

CC genome and a method of identifying a gene, where its expression is

cc antered in the seed, leaf, stem, panicle, pollen, root or is constitutive

CC in a plant cell. The plant is a cereal, e.g. soybean, alfalfa, sunflower,

CC canola, cotton, peanut, tobacco or sugar best, preferably maize, barley,

CC sorghum, rice or wheat. The polymuclectides and the polypeptides they

CC sorghum, rice or wheat the polymuclectides and the polypeptides they

CC encode are useful for manipulating crop plants to alter or improve

CC proteins, to incur resistance to insecticides, viruses or fungi, and to

CC incur stress tolerance (e.g. salt, cold or drought) to ensure the plants

CC early flowering or altered metabolic pathways. This sequence are represents a

CC plant nucleic acid of the invention. Note: The sequence data for this

CC plant nucleic acid of the invention are the sequence data for this

CC plant nucleic acid of the invention are the sequence data for this

CC plant nucleic acid of the printed specification but was obtained in

CC electronic format directly from USPTO at sequence has powers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

Claim 48; SEQ ID NO 14082; 89pp; English.

22 and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polypucleotides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polypucleotides. Also disclosed are reethods for using the polypucleotides and polypeptides to alter the responsiveness of a plant to abjoict extress. The invention is useful in 22 agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abjoict extress condition. It is also useful for selecting an agent that alters abjoict stress regulated 22 polypucleotide expression in a plant cell, and to identify a homolog or ortholog to an abjoict extress responsive polypucleotide. The nucleic acid 22 molecule and the polypeptide encoded by it are useful in altering the molecule and the polypeptide encoded by it are such as cold stress, salt stress, osmotic stress or any of their combinations. The present sequence of is used in the exemplification of their nombinations. a homolog or he nucleic acid sequence

Identifying at least one gene involved in plant resistance or response pathogenic infection for conferring resistance or tolerance to a plant bacterial, fungal or viral infection by determining or detecting plant gene expression. ה ל ס

27; SEQ ID NO 5386; 899pp; English

The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered ä

the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to illustrate the invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
